40

Top 10 hottest residential blocks (1 = hottest)

Study area

Four hot areas

The 10 blocks cluster into 4 groups:

A · Charr / Fort Villa
blocks 1, 3, 10 · 47.2–47.9 °C
B · Cavalry Ground
blocks 5, 6, 8 · 47.2 °C, least vegetation
C · Malakpur
blocks 2, 7 · 47.2–47.3 °C
D · DHA Phase 7
blocks 4, 9 · 47.2 °C

Place names: OpenStreetMap

Method. Landsat 8/9 Collection 2 Level-2 scenes (May–June 2021–2025), cloud-masked, median composite in Google Earth Engine. The study area was split into 250 m × 250 m blocks; blocks were kept only if ≥40% of their area is residential buildings and ≤20% non-residential (GHSL built-up characteristics, 2018). The 10 hottest by mean LST are outlined.
Finding. Across 1,900 blocks, greener blocks ran cooler: the greenest quarter averaged 43.7 °C vs 46.6 °C for the least green.
Note. Land *surface* temperature, not air temperature. The rectangular study area covers DHA and neighbouring parts of Lahore Cantonment. Sites still need checking on the ground.
