Lahore Urban Heat & Tree-Planting Priorities

Landsat land surface temperature composite · May–June, 2021–2025

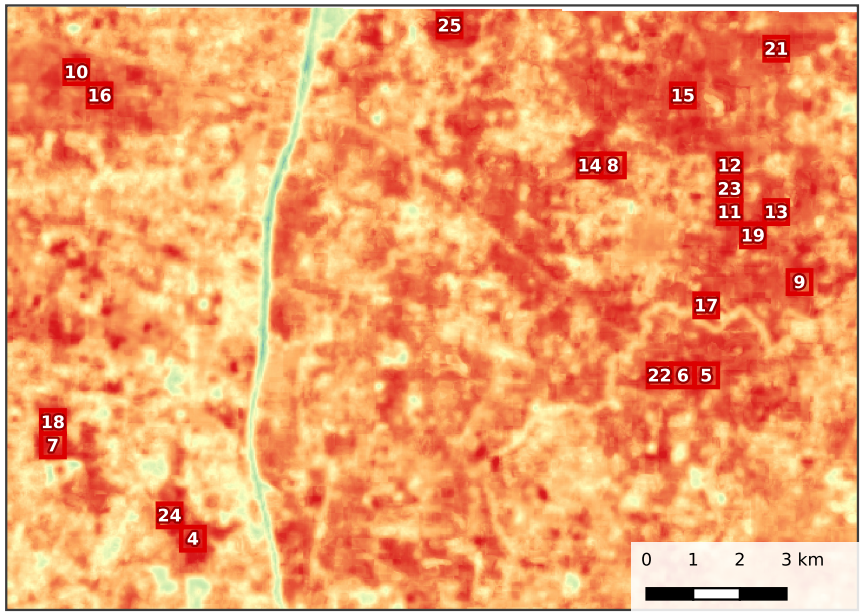

Legend

Land surface temperature (°C)

52
32

Top 25 hottest blocks (numbered by rank, 1 = hottest)

Detail: north-west hotspot cluster (21 of the 25 blocks)

How to read this map. Colours show mean land surface temperature (LST), May–June 2021–2025: blue = cooler, red = hotter. Red outlines mark the 25 hottest 500 m grid blocks, numbered by rank. The dashed box on the main map shows the area of the detail map.

Important. This is land *surface* temperature, not air temperature. Outlined blocks are candidates for further investigation; tree-planting suitability (space, access, water, ownership) has not been verified on the ground.

Data & method. Landsat LST, NDVI and NDBI layers (30 m pixels) composited in Google Earth Engine. The city was divided into 13,926 blocks of 500 m × 500 m (UTM 43N); mean LST, NDVI and NDBI were computed per block. Outlined blocks have mean LST of 50.5–53.1 °C. Map produced in QGIS.
